(54) Title: IMPROVED CORED ELECTRODE WIRES			
(57) Abstract <p>A cored electrode wire for pulsed electric arc welding, wherein said core includes from 2.5 to 12% calcium fluoride, from 2 to 8% calcium carbonate, from 0.2 to 2% silicon dioxide and from 0.5 to 1.5% of a fused mixed oxide. Also disclosed is a cored electrode wire for pulsed electric arc welding, wherein said core contains from 4 to 15% elemental manganese and from 2 to 8% elemental silicon, the remainder of the core comprising fused mixed oxide, desired alloying components and iron powder. In each of the above cases, the wire is suitable for use with the following welding pulse parameters: pulse energy: 8 to 250 J and preferably 10 to 120 J; pulse frequency: 10 to 500 Hz and preferably 15 to 350 Hz; back-ground current: 8 to 250 A and preferably 10 to 100 A; wire feed speed: 1 to 20 m/min and preferably 4 to 17 m/min.</p>

1 TITLE: IMPROVED CORED ELECTRODE WIRES

2 Field of the Invention:

3 This invention relates to cored electrode wires for
4 pulsed electric arc welding and to a pulsed electric arc
5 welding method utilising same.

6 Background of the Invention:

7 Solid electrode wire generally suffers from lack of
8 versatility in alloy composition, since only large batches
9 are economical, and absence of the protective and cleaning
10 action provided by a slag. In addition, the solid wire/
11 conventional power supply combination can give problems with
12 lack of sidewall fusion in joining thicker sections.

13 Cored wires offer great versatility with regard to
14 alloy composition since alloy additions are made via the
15 core. They also generally give better sidewall fusion than
16 solid wires. To reliably achieve the good low temperature
17 impact properties and low weld metal hydrogen levels
18 required in certain cases, basic-flux cored or metal cored
19 wires demonstrate considerable advantage compared to
20 alternative slag systems such as rutile ones.

21 However, the combination of basic cored wire with
22 conventional power supply gives harsh welding operation, can
23 be used only in a narrow range of welding currents, and is
24 not usable for positional welding. The combination of basic
25 cored wire with pulsed power supply, on the other hand, has
26 been found to give good welding behaviour over a wide range
27 of welding currents and to offer an all-position welding
28 capability. Similarly, metal cored wires are only usable at
29 high currents with conventional power supply but, when
30 combined with pulsed power supply give good welding
31 behaviour over a wide range of welding currents and offer
32 all-position welding capability.

33 Summary of Invention and Objects:

34 It is therefore an object of a first aspect of the
35 present invention to provide cored electrode wires which are
36 suitable for use with pulsed electric arc welding programs,
37 and to provide a range of programmes suitable for use
38 therewith.

- 2 -

1 In a first aspect, the invention provides a basic flux
2 cored electrode wire for pulsed electric arc welding,
3 characterised in that the slag forming components contained
4 in the core of said electrode wire are of a lower level than
5 the slag forming components which must be contained in a
6 basic flux cored wire suitable for normal arc welding.

7 In a preferred form of the first aspect of the
8 invention, the core includes from 2.5 to 12% calcium
9 fluoride, from 2 to 8% calcium carbonate, from 0.2 to 2%
10 silicon dioxide and from 0.5 to 1.5% of a fused mixed oxide.

11 In a particularly preferred form of the invention, the
12 core includes from 2.5 to 8% calcium fluoride, from 2 to 6%
13 calcium carbonate, from 0.2 to 1% silicon dioxide and from
14 0.75 to 1.25% fused mixed oxide. In one form, the fused
15 mixed oxide may contain approximately 10% MgO, 15% MnO, 10%
16 Al_2O_3 , 5% CaO, 60% SiO_2 .

17 The above defined electrode is suitable for pulsed arc
18 welding with the following pulse parameters:

19 Pulse Energy	8 to 250 J and preferably 10 to 120 J
20 Pulse Frequency	10 to 500 Hz and preferably 15 to 350 Hz
21 Background Current	8 to 250 A and preferably 10 to 100 A
22 Wire Feed Speed	1 to 20 m/min and preferably 4 to 17
23	m/min

24 In a presently preferred form of the invention, the
25 core may have the following composition and is suitable for
26 use with a pulsed electric arc welding program having the
27 following pulse parameters:

28 Wire Diameters 0.9 to 1.8 mm

29 Shielding Gas Argon-carbon dioxide mixtures containing 2 to
30 25% CO_2 and, in some cases, up to 3% O_2 .

31 Proportion of core - 15 to 28% of total wire weight may be
32 core

33 - preferably 18 to 25% of core

34 - specifically 23% core for 1.6mm dia
35 wires and 21% for 1.2mm dia wires.

<u>Pulse Parameters</u>		<u>Range</u>
Pulse width (ms)		2 to 6
Peak current (A)		400 to 550
Minimum Pulse Frequency (Hz)		15 to 80

SUBSTITUTE SHEET

- 4 -

1	Maximum Pulse Frequency (Hz)	120 to 300
2	Minimum Background Current (A)	15 to 50
3	Maximum Background Current (A)	15 to 80
4	Minimum Wire Speed (m/min)	1.56 to 4.55
5	Maximum Wire Speed (m/min)	6.50 to 16.90

6 The specific combination of parameters needs to be
7 optimized for each specific wire.

8 In a second aspect, the invention provides a method of
9 operating a pulsed electric arc welding apparatus using a
10 cored electrode wire having a basic core composition
11 comprising the steps of adjusting the parameters of the
12 pulse program of the apparatus in accordance with the
13 following:

14	Pulse Energy	8 to 250 J and preferably 10 to 120 J
15	Pulse Frequency	10 to 500 Hz and preferably 15 to 350 Hz
16	Background Current	8 to 250 A and preferably 10 to 100 A
17	Wire Feed Speed	1 to 20 m/min and preferably 4 to 17
18		m/min

19 More specifically, the following parameters may be
20 used:

21	<u>Pulse Parameters</u>	<u>Range</u>
22	Pulse width (ms)	2 to 6
23	Peak current (A)	400 to 550
24	Minimum Pulse Frequency (Hz)	15 to 80
25	Maximum Pulse Frequency (Hz)	120 to 300
26	Minimum Background Current (A)	15 to 50
27	Maximum Background Current (A)	15 to 80
28	Minimum Wire Speed (m/min)	1.56 to 4.55
29	Maximum Wire Speed (m/min)	6.50 to 16.90

30 In a particularly preferred form of this aspect, the
31 core composition of the electrode wire is in accordance with
32 the definition of the first aspect of the invention
33 appearing above.

34 In a third aspect of the invention, the invention
35 provides a cored electrode wire for use with pulsed electric
36 arc welding, characterised in that the core contains a metal
37 powder composition having less manganese and silicon than
38 would be required for a cored wire for use with normal

- 5 -

1 electric arc welding.

2 It will be appreciated that the inclusion of manganese
3 and silicon in a cored wire for use with normal electric arc
4 welding influences the running characteristics and bead
5 shape of the weld metal. If insufficient manganese and
6 silicon are included in the core, the bead shape will be
7 poor and the resulting weld will have inferior mechanical
8 properties. By using a cored wire in conjunction with a
9 pulsed electric arc welding program, the present inventors
10 have found that less manganese and silicon may be included
11 in the core without adversely affecting the bead shape or
12 running characteristics, thereby resulting in superior
13 mechanical properties in the resultant weld.

14 In a preferred form of this aspect of the invention,
15 the core contains from 4 to 15%, and preferably 6 to 10% of
16 elemental manganese and from 2 to 8% and preferably from 2.5
17 to 5% elemental silicon.

18 The above electrode is suitable for pulsed arc welding
19 with the following pulse parameters:

20 Pulse Energy	8 to 250 J and preferably 10 to 120 J
21 Pulse Frequency	10 to 500 Hz and preferably 15 to 350 Hz
22 Background Current	8 to 250 A and preferably 10 to 100 A
23 Wire Feed Speed	1 to 20 m/min and preferably 4 to 17
24	m/min

25 In a particularly preferred form of this aspect, the
26 core composition is as defined below and the pulse
27 parameters of the pulsed electric arc welding program
28 suitable for use with the cored wire are as follows:

29 Wire Diameters 0.9. to 1.8 mm

30 Shielding Gas Argon-carbon dioxide mixtures containing 2 to
31 25% CO₂ and, in some cases, up to 3% O₂.

32 Proportion of core - 15 to 25% of total wire weight may be
33 core

34 - preferably 17 to 23% of core

35 - specifically 21% core for 1.6mm dia
36 wires and 1.2mm dia wires.

37

- 7 -

1 Th specific combination of parameters needs to be
2 optimized for each specific wire.

3 In a fourth aspect of the present invention, there is
4 provided a method of pulsed electric arc welding utilising a
5 cored electrode wire containing a metallic core,
6 characterised in that the electric arc welding apparatus is
7 programmed with the following pulse parameters:

8 Pulse Energy	8 to 250 J and preferably 10 to 120 J
9 Pulse Frequency	10 to 500 Hz and preferably 15 to 350 Hz
10 Background Current	8 to 250 A and preferably 10 to 100 A
11 Wire Feed Speed	1 to 20 m/min and preferably 4 to 17
12	m/min

13 More specifically, the following parameters may be
14 used:

15 <u>Pulse Parameters</u>	<u>Range</u>
16 Pulse width (ms)	2 to 6
17 Peak current (A)	350 to 550
18 Minimum Pulse Frequency (Hz)	25 to 100
19 Maximum Pulse Frequency (Hz)	120 to 350
20 Minimum Background Current (A)	10 to 50
21 Maximum Background Current (A)	20 to 100
22 Minimum Wire Speed (m/min)	1.26 to 3.78
23 Maximum Wire Speed (m/min)	5.20 to 15.60

24 Brief Description of the Drawings:

25 Figure 1 is a graph showing the variation of deposition
26 rate with welding current for a basic cored wire/pulsed
27 welding process embodying the invention compared to that
28 normally obtained from a non-pulsed commercially available
29 basic cored wire;

30 Figure 2 is a graphical summary of yield strength and
31 Charpy impact results obtained from wires embodying the
32 invention;

33 Figure 3 is a graph showing the variation of deposition
34 rate with welding current for a metal cored wire/pulsed
35 welding process embodying th invention compared with a
36 conventional metal cored wire using non-pulsed welding.

37 Description of Preferred Embodiments:

38 Several preferred embodiments of each of the above

SUBSTITUTE SHEET

- 8 -

1 aspects of the invention will now be described in greater
2 detail. The examples of preferred embodiments of the basic
3 cored electrode wire resulted from substantial
4 experimentation.

5 The welding power supply used was a Welding Industries
6 of Australia CDT Pulse Welder. A personal computer was
7 attached, via a serial link, to the pulse program storage
8 area of the power supply controls. This allowed any of the
9 ten pulse parameters in the pulse programme being used to be
10 altered at will. A commercial package would include supply
11 of an EPROM for installation into the CDT pulse welder or
12 other pulse welder, with the optimum pulse program for a
13 specific wire.

14 Example 1 - Basic wire-pulse combinations for joining HY80
15 steel.

16 One of the early experimental wires of 1.6mm diameter
17 was chosen and an exercise undertaken to find a combination
18 of pulse parameters which gave optimum operating behaviour
19 over a wide current range. This resulted in a pulse program
20 which gave good welding behaviour, a flat to slightly convex
21 fillet shape and very little spatter over the welding
22 current range 130 to 350A. Furthermore, the lower end of
23 this range (about 130 to 150A) could be used for positional
24 welding with slightly convex but acceptable vertical and
25 overhead stringer beads being achievable. Weave techniques
26 allowed the production of good profile positional fillet
27 welds.

28 Measurements were made of the variation of deposition
29 rate and efficiency with welding current using a
30 representative wire and pulse program. The deposition rate
31 results, together with those obtained previously for a
32 commercially available basic flux cored wire under steady
33 current conditions are given in Fig. 1. These show that
34 higher deposition rates at given current occur under pulsed
35 conditions and that the process under development can give
36 deposition rates of up to 7 kg of weld metal/hour at usable
37 welding current. The deposition efficiency of the
38 experimental wire was 95 to 97% across the current range.

- 9 -

1 It should be noted that the Fig. 1 graph of deposition
2 rate against cement applies to any 1.6 mm diameter basic
3 wire embodying the invention under pulse conditions.

4 A series of experimental wires were formulated to
5 investigate the influence of alloying additions, principally
6 Mn, Ni, Mo, Ti and B, on the all-weld-metal mechanical
7 properties. The Table below gives the nominal deposit
8 compositions aimed for, and classifies the wires according
9 to the general approach used. The weld metal from all wires
10 contained approximately 0.06%C and 0.3 to 0.4% Si.

11	<u>Wire General</u>		<u>Nominal Composition (wt %)</u>

36 Test plates were welded from each of these wires using
37 the pulse program developed. The parent plate was C-Mn steel
38 (250 Grade) of 19mm thickness while the joint preparation

SECRET

- 10 -

1 and interpass temperature were as specified by the American
2 Welding Society (ANSI/AWS A5. 20-79, 1978) for all-weld test
3 plates. Welding was done in the flat position with
4 mechanized travel and a heat input of 1.7 kJ/mm. One all-
5 weld-metal tensile test specimen (50mm gauge length) and
6 three to five Charpy V-notch impact specimens were taken
7 from each test plate. Charpy testing was done at -51°C.

8 Figure 2 is a schematic representation of the impact
9 and tensile results obtained using the wire numbers from the
10 table. Also marked on this figure are the minimum Charpy
11 values specified and the range of yield strength values
12 specified. This figure illustrates several important
13 features of the results. It is apparent that premium Charpy
14 results, of above say 100J at -51°C, were only obtained with
15 wires microalloyed with Ti and 50 ppm B. These premium
16 Charpy results could be obtained using two distinct Mn-Ni
17 combinations: 1.2% Mn - 1.6% Ni with additions of 0.2% Mo or
18 0.02% of Al (wires 15 and 21); or 1.0% Mn - 3.0% of Ni with
19 no further addition (wire 23).

20 The yield strength results show that, of the wires
21 giving premium Charpy values, wires 21 and 23 are within the
22 range specified while wire 15 is marginally too high. Wires
23 15 and 23 gave 22% tensile elongation while wire 21 gave
24 26%.

25 Diffusible hydrogen in weld metal from these wires was
26 found to be 2 to 3 ml/100g of weld metal using the IIW
27 procedure and a gas chromatography measuring system.

28 Metallographic examination revealed that the as-welded
29 microstructure from wires giving premium impact properties
30 contained at least 90% of fine grained constituents
31 nucleated within prior austenite grains, such as acicular
32 ferrite and intragranular polygonal ferrite.

33 Based on the all-weld-metal results described above
34 wires 15, 18, 21 and 23 were selected for further
35 assessment. Flat position test plates were welded from 16mm
36 thick HY80 steel using the "groov weld metal test" geometry
37 described in U.S. Military Specification MIL-E-24403/2A
38 (SH), 1983. Heat input was approximately 1.7 kJ/mm. From

- 11 -

1 these test plates one all-weld tensile specimen, ten Charpy
 2 specimens and three dynamic tear specimens were machined.
 3 Half of the Charpy specimens were tested at -18°C and half
 4 at -51°C while the dynamic tear tests were done at -29°C .
 5 The table below lists the average values of the results.

Wire No.	<u>Tensile</u>		<u>Charpy V-notch</u>		<u>Dynamic Tear</u>
	<u>Yield</u>	<u>Elongation</u>	<u>Av at -18°C</u>	<u>Av at -51°C</u>	<u>Av at -29°C</u>
	(MPa)	(%)	(J)	(J)	(J)
15	687	24	92	50	419
18	673	22	118	64	584
21	664	23	120	74	528
23	638	23	113	87	676

13 The yield strengths are considerably increased, by
 14 between 35 and 90 MPa, compared to the all-weld-metal
 15 results. This is due to incorporation in the weld of
 16 alloying elements from the parent plate and, as a result,
 17 wires 15, 18 and 21 (marginally) give yield strength values
 18 which are too high. Wire 23 has yield strength and
 19 elongation properties meeting the requirements of the U.S.
 20 Military Specification referred to above. All wires meet the
 21 dynamic tear requirements of the U.S. Military
 22 Specification.

23 Overall therefore wire 23, which gives a nominal weld
 24 metal composition of 1% Mn, 3% Ni plus microalloying
 25 additions of Ti and B, gives welds in HY80 steel having the
 26 best strength, elongation and impact properties.

27 The core composition and specific pulse parameters used
 28 for wire 23 are listed below:

<u>Core Composition</u>	<u>% by weight</u>
Iron powder	64.6
Manganese powder	4.1
Ferrosilicon	4.1
Fluorspar	5.3
Marble	4.1
Silica	0.4
Fused mixed oxide	1.0
Nickel powder	13.0
Ferrotitanium	1.0

- 12 -

1	Iron/Ferroboration agglomerate	2.4
2	<u>Pulse parameters</u>	
3	Pulse width	3.5 ms
4	Peak current	520A
5	Minimum frequency	40 Hz
6	Maximum frequency	160 Hz
7	Minimum background current	35A
8	Maximum background current	35A
9	Minimum wire speed (m/min)	2.08
10	Maximum wire speed (m/min)	9.10
11	It will be appreciated that any combination of pulse	
12	parameters which achieve the more general pulse parameters	
13	defined above will be satisfactory and will be open to	
14	selection by an experienced operator.	
15	The following examples of preferred basic flux wires	
16	for joining normal structural steels resulted from the above	
17	tests and further experimentation:	
18	<u>Example 2</u>	
19	Wire of 1.6mm diameter with 23% fill for joining normal	
20	structural grade steels using Argon - 18% CO ₂ shielding gas.	
21	(Wire 244, Test plate MI)	
22	<u>Core Composition</u>	% by weight
23	Iron powder	76.8
24	Silico manganese	9.8
25	Ferrosilicon	2.6
26	Fluorspar	5.3
27	Marble	4.1
28	Silica	0.4

10 test

11 Diffusible hydrogen less than 3 ml/100g

12 The results show that the combination of basic-flux
13 cored wires and specifically programmed pulse welding
14 provides a versatile welding process with enhanced
15 usability. High deposition downhand welding and an all-
16 position capability can be achieved with a single pulse
17 program by altering the wire feed speed and hence the
18 welding current. Furthermore, the impact and tensile
19 properties obtained from the alloy combination of wire 23
20 when using this process meet or exceed the requirements of
21 joining HY80 steel. The requirement on diffusible hydrogen
22 level is also readily met.

23 These results suggest that this combination should be
24 suitable for all-position joining of such steels and of
25 offering considerable advantages over presently available
26 processes.

27 The principal advantage of the above embodiments
28 compared to conventional basic wire welding is in the
29 improved operating behaviour and bead shape. The basic wire-
30 pulse welding combination allows a much wider range of
31 average welding currents to be used and makes all-position
32 welding with basic wires practical. An example of the
33 extended current range achieved is that, for a 1.6 mm
34 diameter basic wire and pulse welding this range is 130 to
35 350A whereas, with convention welding the range is 230 to
36 300A.

37 This advantage is illustrated in the following example
38 of a test-plate welded in the vertical position using pulse

- 16 -

1 welding, it being appreciated that it is not practical to
2 produce such a test-plate by conventional means.

3 Example 5

4 Wire of 1.2 mm diameter with 21% fill for joining
5 normal structural grade steels using Ar. 18% CO₂ shielding
6 gas (wire 244/9, test-plate LB63.

7 Core Composition and Pulse Parameters (as in Example 3).

8 Operation

9 Good vertical position welding operation illustrated by fact
10 that sound Vee-butt test plate produced to Lloyds Register
11 of Shipping "Approval of Welding Consumables" requirements.

12 Weld

13 Composition (wt %) c .07

14 Mn 1.38

15 Si .51

16 Impact Properties average of 96 J at -20°C in
17 Charpy test

18 Transverse tensile test met requirements of Lloyds
19 Register of Shipping.

20 Face and Root bend tests met requirements of Lloyds
21 Register of Shipping.

22 In addition to the above described advantages, the
23 basic cored wires contain significantly less slag forming
24 components in the core thereby resulting in less troublesome
25 welding performance while maintaining the necessary quality
26 of the weld.

27 Tests similar to the above were conducted in relation
28 to various metal cored wires, and the following examples of
29 preferred embodiments resulted:

30 Examples - Metal Cored Wires

31 Example 6 - Wire of 1.6mm diameter with 21% fill for joining
32 normal structural grade steels using Argon - 18% CO₂
33 shielding gas. (Wire 345, Test plate NA).

5	Maximum wire speed (m/min)	11.96

6 Operation

7 Very good operation and bead shape over entire range for
 8 flat and horizontal welding positions plus very good all-
 9 position welding capability at low and intermediate wire
 10 feed speeds.

11 Weld Metal

12 Composition (wt %) 0.06% C, 1.49% Mn, 0.62 Si, 0.04 % Ti,
 13 0.0055% B

14 Tensile properties 589 MPa tensile strength,
 15 23% elongation

16 Impact properties average of 123J at -20°C in Charpy
 17 test

18 There are two principal advantages of using the above
 19 metal cored wires with pulsed welding compared to
 20 conventional welding with metal cored wire. Firstly, in
 21 common with the above basic wires, the range of usable
 22 welding currents is much wider so that all-position welding
 23 becomes practical at the lower currents. With 1.6 mm
 24 diameter metal cored wire and pulsed welding for example the
 25 range of average current that is usable is 120 to 350 A
 26 while, with conventional welding it is 280 to 340A. This
 27 could be illustrated using an example, along similar lines
 28 to that above for the basic wire, of results from a vertical
 29 weld.

30 The second principal advantage concerns the improved
 31 weld mechanical properties obtained. This difference between
 32 pulse and conventional metal cored wires is illustrated by
 33 the following:

34	Wire Number	<u>328</u>	<u>345</u>)see Example
35	Welding Method	conventional	pulsed) 6 for
36				details
37	Test plate type	all weld metal	all weld metal	

38

1 Weld Composition (wt%)

5 Weld Properties

9 The difference in impact properties is most important
0 because it allows the wire/pulse combination to be used in
1 more critical applications. In addition to these advantages,
2 the amounts of manganese and silicon are reduced, thereby
3 improving the mechanical properties of the weld, without
4 compromising the running characteristics and bead shape of
5 the weld.

17 Wire of 1.6 mm diameter with 21% fill to American
18 Welding Society classification E111TG-K3 for joining high
19 strength steels and using Argon - 18% CO₂ shielding gas (Wire
20 359, test plate UH).

31 Pulse parameters

SUBSTITUTE SHEET

- 20 -

1	Maximum wire speed (m/min)	7.56
---	----------------------------	------

2 Operation

3 Very good operation and bead shape over entire range for
4 flat and horizontal welding positions. Has all-position
5 welding capability at lower wire feed speeds.

6 Weld Metal

7 Composition (wt %) 0.05% C, 1.49% Mn, 0.40% Si, 2.6% Ni,
8 0.12% Cr, 0.56% Mo, 0.04% Ti, 0.005% B

9 Tensile properties 686 MPa yield strength,
10 797 MPa tensile strength,
11 24% elongation.

12 Impact properties average of 41J at -18°C in Charpy
13 test

14 Diffusible hydrogen 2 to 4 ml/100g

15 It will be appreciated from the above that the improved
16 cored electrode wires enable pulsed electric arc welding to
17 be performed and result in welds which are superior to welds
18 performed by known cored electrode wires using non-pulsed
19 electric arc welding techniques.

20 The various components of the core of the wire may be
21 modified without detracting from the advantages provided by
22 the present invention. For example, the various alloying
23 components may be modified to suit the required weld metal
24 properties. Similarly, the components of the fused metal
25 oxide used in each core may be modified to suit the user's
26 requirements provided the core contains sufficient easily
27 ionizable material to result in satisfactory improvement of
28 the weld quality.

- 21 -

1 CLAIMS:

- 2 1. A cored electrode wire for pulsed electric arc welding,
3 characterised in that the slag forming components contained
4 in the core of said electrode wire are of a lower level than
5 the slag forming components which must be contained in a
6 cored wire suitable for normal arc welding.
- 7 2. The electrode wire of claim 1, wherein said core
8 includes from 2.5 to 12% calcium fluoride, from 2 to 8%
9 calcium carbonate, from 0.2 to 2% silicon dioxide and from
10 0.5 to 1.5% of a fused mixed oxide.
- 11 3. The electrode wire of claim 1 or 2, wherein said core
12 includes from 2.5 to 8% calcium fluoride, from 2 to 6%
13 calcium carbonate, from 0.2 to 1% silicon dioxide and from
14 0.75 to 1.25% fused mixed oxide.
- 15 4. The electrode wire of claim 3, wherein said fused mixed
16 oxide contains approximately 10% MgO, 15% MnO, 10% Al₂O₃, 5%
17 CaO, 60% SiO₂.
- 18 5. A cored electrode wire for pulsed electric arc welding,
19 in which the wire diameter is from 0.9 to 1.8 mm, and the
20 core constitutes from 15 to 28% of the weight of the wire,
21 said core have from 3 to 12% elemental manganese, from 2 to
22 7% elemental silicon, from 2.5 to 12% calcium fluoride, from
23 2 to 8% calcium carbonate, from 0.2 to 2% silicon dioxide,
24 from 0.5 to 1.5% fused mixed oxide, from 0 to 1.5% elemental
25 chromium, from 0 to 15% nickel, from 0 to 5% molybdenum,
26 from 0 to 1.5% titanium, from 0 to 0.045% boron, the
27 remainder of the core composition being iron powder.
- 28 6. The electrode wire of claim 5, wherein the core
29 comprises from 18 to 25% of the weight of the wire, said core
30 comprising from 5 to 9% elemental manganese, from 2 to 5%
31 elemental silicon, from 2.5 to 8% calcium fluoride, from 2 to
32 6% calcium carbonate, from 0.2 to 1% silicon dioxide, from
33 0.75 to 1.25% fused mixed oxide, from 0 to 0.8% titanium, and
34 from 0 to 0.033% boron.
- 35 7. The electrode wire of any preceding claim, when used
36 with a pulsed electric arc welding apparatus having the
37 following welding pulse parameters:
- 38

INSTITUTE SHEET

- 22 -

- 1 Pulse Energy 8 to 250 J
- 2 Pulse Frequency 10 to 500 Hz
- 3 Background Current 8 to 250 A
- 4 Wire Feed Speed 1 to 20 m/min
- 5 8. The electrode wire of any preceding claim, when used
- 6 with a pulsed electric arc welding apparatus having the
- 7 following welding pulse parameters:
- 8 Pulse Energy 10 to 120 J
- 9 Pulse Frequency 15 to 350 Hz
- 10 Background Current 10 to 100 A
- 11 Wire Feed Speed 4 to 17 m/min
- 12 9. The electrode wire of claim 7 or 8, wherein the pulse
- 13 parameters are:
- 14 Pulse width (ms) 2 to 6
- 15 Peak current (A) 400 to 550
- 16 Minimum Pulse Frequency (Hz) 15 to 80
- 17 Maximum Pulse Frequency (Hz) 120 to 300
- 18 Minimum Background Current (A) 15 to 50
- 19 Maximum Background Current (A) 15 to 80
- 20 Minimum Wire Speed (m/min) 1.56 to 4.55
- 21 Maximum Wire Speed (m/min) 6.50 to 16.90
- 22 10. The electrode wire of claim 9, wherein the core
- 23 composition of the wire and the pulse parameters used are as
- 24 defined in any one of Examples 1 to 4 of the accompanying
- 25 specification.
- 26 11. A cored electrode wire for use with pulsed electric arc
- 27 welding, characterised in that the core contains a metal
- 28 powder composition having less manganese and silicon than
- 29 would be required for a cored wire for use with normal
- 30 electric arc welding.
- 31 12. The electrode wire of claim 11, wherein said core
- 32 contains from 4 to 15% elemental manganese and from 2 to 8%
- 33 elemental silicon, the remainder of the core comprising
- 34 fused mixed oxide, desired alloying components and iron
- 35 powder.
- 36 13. The electrode wire of claim 12, wherein said core
- 37 contains from 6 to 9% f elemental manganese and from 2.5 to
- 38 5% elemental silicon.

- 23 -

1 14. The electrode wire of claim 13, wherein said wire has a
2 diameter of from 0.9 to 1.8 mm and the core comprises from
3 15 to 25% of the weight of the wire, said core composition
4 comprising from 4 to 12% elemental manganese, from 2 to 8%
5 elemental silicon, from 0 to 1% titanium, from 0 to 1.5%
6 fused mixed oxide, from 0 to 0.05% boron, from 0 to 2%
7 elemental chromium, from 0 to 20% nickel, from 0 to 5%
8 molybdenum, the remainder of the core being iron powder.

9 15. The electrode wire of claim 14, wherein said fused
10 mixed oxide contains approximately 10% MgO, 15% MnO, 10%
11 Al₂O₃, 5% CaO, 60% SiO₂.

12 16. The electrode wire of any one of claims 9 to 13, when
13 used with a pulsed electric arc welding apparatus having the
14 following pulse parameters:

15 Pulse Energy 8 to 250 J

16 Pulse Frequency 10 to 500 Hz

17 Background Current 8 to 250 A

18 Wire Feed Speed 1 to 20 m/min

19 17. The electrode wire of any one of claims 9 to 13, when
20 used with a pulsed electric arc welding apparatus having the
21 following pulse parameters:

22 Pulse Energy 10 to 120 J

23 Pulse Frequency 15 to 350 Hz

24 Background Current 10 to 100 A

25 Wire Feed Speed 4 to 17 m/min

26 18. The electrode wire of claim 17, wherein said pulse
27 parameters are:

28 Pulse width (ms) 2 to 6

29 Peak current (A) 350 to 550

30 Minimum Pulse Frequency (Hz) 25 to 100

31 Maximum Pulse Frequency (Hz) 120 to 350

32 Minimum Background Current (A) 10 to 50

33 Maximum Background Current (A) 20 to 100

34 Minimum Wire Speed (m/min) 1.26 to 3.78

35 Maximum Wire Speed (m/min) 5.20 to 15.60

36 19. The electrode wire of claim 18, wherein said core
37 composition and said pulse parameters are as defined in any
38 one of Examples 6 to 8 of the accompanying specification.

- SUBSTITUTE SHEET

- 24 -

1 20. A method of operating a pulsed electric arc welding
2 apparatus using a cored electrode wire having a basic core
3 composition comprising the steps of adjusting the parameters
4 of the pulse program of the apparatus in accordance with the
5 following:

6 Pulse Energy	8 to 250 J
7 Pulse Frequency	10 to 500 Hz
8 Background Current	8 to 250 A
9 Wire Feed Speed	1 to 20 m/min

10 21. The method of claim 20, wherein said pulse parameters
11 are:

12 Pulse Energy	10 to 120 J
13 Pulse Frequency	15 to 350 Hz
14 Background Current	10 to 100 A
15 Wire Feed Speed	4 to 17 m/min

16 22. The method of claim 21, wherein said pulse parameters
17 are:

18 Pulse width (ms)	2 to 6
19 Peak current (A)	400 to 550
20 Minimum Pulse Frequency (Hz)	15 to 80
21 Maximum Pulse Frequency (Hz)	120 to 300
22 Minimum Background Current (A)	15 to 50
23 Maximum Background Current (A)	15 to 80
24 Minimum Wire Speed (m/min)	1.56 to 4.55
25 Maximum Wire Speed (m/min)	6.50 to 16.90

26 23. A method of pulsed electric arc welding utilising a
27 cored electrode wire containing a metallic core,
28 characterised in that the electric arc welding apparatus is
29 programmed with the following pulse parameters:

30 Pulse Energy	8 to 250 J
31 Pulse Frequency	10 to 500 Hz
32 Background Current	8 to 250 A
33 Wire Feed Speed	1 to 20 m/min

34 24. A method of pulsed electric arc welding utilising a
35 cored electrode wire containing a metallic core,
36 characterised in that the electric arc welding apparatus is
37 programmed with the following pulse parameters:

38

- 25 -

- 1 Pulse Energy 10 to 120 J
- 2 Pulse Frequency 15 to 350 Hz
- 3 Background Current 10 to 100 A
- 4 Wire Feed Speed 4 to 17 m/min

5 25. A method of pulsed electric arc welding utilising a
6 cored electrode wire containing a metallic core,
7 characterised in that the electric arc welding apparatus is
8 programmed with the following pulse parameters:

- 9 Pulse width (ms) 2 to 6
- 10 Peak current (A) 350 to 550
- 11 Minimum Pulse Frequency (Hz) 25 to 100
- 12 Maximum Pulse Frequency (Hz) 120 to 350
- 13 Minimum Background Current (A) 10 to 50
- 14 Maximum Background Current (A) 20 to 100
- 15 Minimum Wire Speed (m/min) 1.26 to 3.78
- 16 Maximum Wire Speed (m/min) 5.20 to 15.60

FURTHER INFORMATION

VI. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING (contd)

This International Searching Authority found multiple inventions in this International application as follows:

Claims 1, 11 and 20 relate to different aspects of welding with no common unifying feature.

Claim 1 is directed to the slag forming content of a welding electrode.

Claim 11 is directed to the components of a welding electrode relevant to weld bead formation.

Claim 20 is directed to a pulsed arc welding process using any welding electrode.

These aspects are entirely independent and require separate searches.

FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V. ☐ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE ¹

This International search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☐ Claim numbers _____, because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claim numbers _____, because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claim numbers _____, because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☒ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²

This International Searching Authority found multiple inventions in this International application as follows:

See attached Sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the International application.

2. ☐ As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims:

3. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers: 1 to 10

4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

☐ The additional search fees were accompanied by applicant's protest.

☐ No protest accompanied the payment of additional search fees.
